

Larkspur Cold-Chain Release Protocol v3.1

Section 1 - Scope

The protocol applies to six-hour vaccine-container qualification runs.

Recorded temperatures must be corrected using a calibration offset valid on the run date.

The Larkspur food warehouse protocol is unrelated and uses different limits.

Section 2 - Release decision

Corrected temperature = recorded temperature + signed calibration offset.

A pallet passes only if every corrected reading is at or below 8.0 C.

A mean below the limit cannot override a single excursion.

If any linked probe lacks a valid calibration, place the pallet on hold.

Report each pallet mean to one decimal place after applying offsets.

Section 3 - Evidence boundaries

Release logs establish temperature performance only.

This protocol contains no product shelf-life extension rule.

Packaging color and courier route do not affect the temperature calculation.

Revision note: v3.1 supersedes v3.0 for runs after 2026-01-01.
